

# Ordering Heuristics for Parallel Graph Coloring

Authors: William Hasenplaugh, Tim Kaler, Tao B. Schardl,  
Charles E. Leiserson

Presentation by Ethan LaBelle

# Definition: Graph-Coloring

- Definition: Vertex Coloring
  - Assignment of a color to each vertex of an undirected graph  $G = (V, E)$ , such that for every edge  $(u, v)$  in  $E$ ,  $u.\text{color} \neq v.\text{color}$
- Find optimal vertex coloring (fewest colors)
- NP-complete problem
- In practice, approximation algorithms are sufficient

# Motivation

- Scheduling data graph computations
  - Sequence of update on vertices of a graph
  - New value of a vertex depends on value of vertex and adjacent vertex values
  - Vertices of same color can be update in parallel
  - Fewer colors  $\Leftrightarrow$  more parallelism
- Other real world applications:
  - Register allocation via Graph Coloring

# Properties of Good Parallel Ordering

- Quality ordering
- Scalable
- Work Efficient

# Greedy Algorithm

**GREEDY**( $G$ )

```
1 let  $G = (V, E, \rho)$ 
2 for  $v \in V$  in order of decreasing  $\rho(v)$ 
3    $C = \{1, 2, \dots, \deg(v) + 1\}$ 
4   for  $u \in v.adj$  such that  $\rho(u) > \rho(v)$ 
5      $C = C - \{u.color\}$ 
6    $v.color = \min C$ 
```

$\rho$ - priority function

What is the required work?

Is this procedure parallelizable?

- Colors a graph with degree  $\Delta$  in at most  $\Delta + 1$  colors

# Greedy Algorithm

GREEDY( $G$ )

```
1  let  $G = (V, E, \rho)$ 
2  for  $v \in V$  in order of decreasing  $\rho(v)$ 
3     $C = \{1, 2, \dots, \deg(v) + 1\}$ 
4    for  $u \in v.adj$  such that  $\rho(u) > \rho(v)$ 
5       $C = C - \{u.color\}$ 
6     $v.color = \min C$ 
```

$\rho$ - priority function

What is the required work?

Is this procedure parallelizable?

- Colors a graph with degree  $\Delta$  in at most  $\Delta + 1$  colors

**Why so many colors?!?!**

The order in which we color the vertices influences the number of colors.

**Greedy** algorithm.

Jones and Plassmann - SIAM J. Scientific Computing, 1993

# Analysis

- Linear work in size of the graph
- Traditional heuristics vulnerable to adversarial inputs causing worst case  $\Omega(V)$  span
  - Why?

# Adversarial Input for JP-LF

**THEOREM 7.** For any  $\Delta > 0$ , there exists a  $\Delta$ -degree graph  $G = (V, E)$  such that JP-LF colors  $G$  in  $\Omega(\Delta^2)$  span and JP-R colors  $G$  in  $O(\Delta \lg \Delta + \lg^2 \Delta \lg V / \lg \lg V)$  expected span.

# LLF Ordering Heuristics

- Largest-log-degree-first
- $\rho(v) = \langle \lceil \log(\deg(v)) \rceil, \rho_R(v) \rangle$
- $\rho_R$  is a random priority function

# Clique-Chain with JP-LFF

# SLL Ordering Heuristic

SLL-ASSIGN-PRIORITIES( $G, r$ )

23 **let**  $G = (V, E)$

24  $i = 1$

25  $U = V$

26 **let**  $\Delta$  be the degree of  $G$

27 **let**  $\rho_R \in \mathbb{R}$  be a random priority function

28 **for**  $d = 0$  to  $\lg \Delta$

29     **for**  $j = 1$  to  $r$

30          $Q = \{u \in U : |u.adj \cap U| \leq 2^d\}$

31         **parallel for**  $v \in Q$

32              $\rho(v) = \langle i, \rho_R(v) \rangle$

33          $U = U - Q$

34          $i = i + 1$

35 **return**  $\rho$

# Analysis

- JP-R, JP-LLF, JP-SLL work efficient
- Span bounds:
  - JP-R:  $O(\lg V + \lg \Delta \cdot \min\{\sqrt{E, \Delta} + \lg \Delta \lg V / \lg \lg V\})$
  - JP-LLF:  $O(\lg \Delta \lg V + \lg \Delta (\min\{\sqrt{E, \Delta}\} + \lg 2 \Delta \lg V / \lg \lg V))$
  - JP-SLL:  $O(\lg \Delta \lg V + \lg \Delta (\min\{\sqrt{E, \Delta}\} + \lg 2 \Delta \lg V / \lg \lg V))$

# Empirical Evaluation

Benchmark suite: 8 real-world graphs and 10 synthetic graphs.

<i><b>Serial Heuristic</b></i>	<i><b>Parallel Heuristic</b></i>	<i><b>Color Ratio</b></i>	<i><b>Efficiency</b></i>	<i><b>Speedup</b></i>
FF	R	1.011	0.417	7.039
LF	LLF	1.021	1.058	7.980
SL	SLL	1.037	1.092	6.082

***Color Ratio***: Ratio of the number of colors used by the parallel heuristic to the serial heuristic.

***Efficiency***: Ratio of serial heuristic running time to the parallel heuristic run on a single core.

***Speedup***: The 12-core speedup of the parallel heuristic.

# “Coarse Hierarchy” In Coloring Quality

FF < R < LLF < LF < SLL < SL

# Implementation Techniques

- Join trees for reducing memory contention on atomic counters
  - (Line 17)
- Bit vectors for assigning colors
  - (Line 19) Word containing adjacent colors, maintained during joins
- Software prefetching
  - (Line 16)

**JP( $G$ )**

```
7 let  $G = (V, E, \rho)$ 
8 parallel for  $v \in V$ 
9    $v.pred = \{u \in V : (u, v) \in E \text{ and } \rho(u) > \rho(v)\}$ 
10   $v.succ = \{u \in V : (u, v) \in E \text{ and } \rho(u) < \rho(v)\}$ 
11   $v.counter = |v.pred|$ 
12 parallel for  $v \in V$ 
13   if  $v.pred == \emptyset$ 
14     JP-COLOR( $v$ )
```

**JP-COLOR( $v$ )**

```
15  $v.color = \text{GET-COLOR}(v)$ 
16 parallel for  $u \in v.succ$ 
17   if JOIN( $u.counter$ ) == 0
18     JP-COLOR( $u$ )
```

**GET-COLOR( $v$ )**

```
19  $C = \{1, 2, \dots, |v.pred| + 1\}$ 
20 parallel for  $u \in v.pred$ 
21    $C = C - \{u.color\}$ 
22 return min $C$ 
```

# “Coarse Hierarchy” In Coloring Quality

# Bonus: Saturation Degree

GREEDY-SD( $G$ )

```
36 let  $G = (V, E)$ 
37 for  $v \in V$ 
38    $v.adjColors = \emptyset$ 
39    $v.adjUncolored = v.adj$ 
40   PUSHORADDKEY( $v, Q[0][|v.adjUncolored|]$ )
41  $s = 0$ 
42 while  $s \geq 0$ 
43    $v = \text{POPORDELKEY}(Q[s][\max \text{KEYS}(Q[s])])$ 
44    $v.color = \min(\{1, 2, \dots, |v.adjUncolored| + 1\} - v.adjColors)$ 
45   for  $u \in v.adjUncolored$ 
46     REMOVEORDELKEY( $u, Q[|u.adjColors|][|u.adjUncolored|]$ )
47      $u.adjColors = u.adjColors \sqcup \{v.color\}$ 
48      $u.adjUncolored = u.adjUncolored - \{v\}$ 
49     PUSHORADDKEY( $u, Q[|u.adjColors|][|u.adjUncolored|]$ )
50      $s = \max\{s, |u.adjColors|\}$ 
51 while  $s \geq 0$  and  $Q[s] = \emptyset$ 
52    $s = s - 1$ 
```

- “Saturation Table”  $Q$

**THEOREM 13.** GREEDY-SD colors a graph  $G = (V, E)$  according to the SD ordering heuristic in  $\Theta(V + E)$  time.

# Bonus: Saturation Degree

GREEDY-SD( $G$ )

```
36 let  $G = (V, E)$ 
37 for  $v \in V$ 
38    $v.adjColors = \emptyset$ 
39    $v.adjUncolored = v.adj$ 
40   PUSHORADDKEY( $v, Q[0][|v.adjUncolored|]$ )
41  $s = 0$ 
42 while  $s \geq 0$ 
43    $v = \text{POPORDELKEY}(Q[s][\max \text{KEYS}(Q[s])])$ 
44    $v.color = \min(\{1, 2, \dots, |v.adjUncolored| + 1\} - v.adjColors)$ 
45   for  $u \in v.adjUncolored$ 
46     REMOVEORDELKEY( $u, Q[|u.adjColors|][|u.adjUncolored|]$ )
47      $u.adjColors = u.adjColors \sqcup \{v.color\}$ 
48      $u.adjUncolored = u.adjUncolored - \{v\}$ 
49     PUSHORADDKEY( $u, Q[|u.adjColors|][|u.adjUncolored|]$ )
50    $s = \max\{s, |u.adjColors|\}$ 
51 while  $s \geq 0$  and  $Q[s] == \emptyset$ 
52    $s = s - 1$ 
```

- “Saturation Table”  $Q$

**THEOREM 13.** GREEDY-SD colors a graph  $G = (V, E)$  according to the SD ordering heuristic in  $\Theta(V + E)$  time.

- Ordering is determined during serial coloring. How to parallelize?

# Acknowledgements

- Professor Leiserson
- Will, Tim

# Results

- Overall, JP-LLF obtains a geometric-mean speedup — the ratio of the runtime on 1 core to the runtime on 12 cores — of 7.83 on the eight real-world graphs and 8.08 on the ten synthetic graphs.
- Similarly, JP-SLL obtains a geometric-mean speedup of 5.36 and 7.02 on the real-world and synthetic graphs, respectively.

# Incidence Degree

- Iteratively colors an uncolored vertex with the largest number of colored neighbors

# Smallest Degree Last

- First remove all lowest degree vertices
- Recursively color the new graph
- Add the removed vertices back and color

# Saturation Degree

- Color an uncolored vertex whose colored neighbors use the largest number of distinct colors

# Lemma 1

The helper routine GET-COLOR, shown in Figure 2, can be implemented so that during the execution of JP on a graph  $G = (V, E, \rho)$ , a call to GET-COLOR( $v$ ) for a vertex  $v \in V$  costs  $\Theta(k)$  work and  $\Theta(\lg k)$  span, where  $k = |v.\text{pred}|$ .

Proof:

- Represent set of colors as an array
- Use sentinels to represent removed elements
  - Lines 20-21 require  $\Theta(k)$  work and  $\Theta(\lg k)$  span
- Implement min as a parallel reduction
  - $\Theta(k)$  work and  $\Theta(\lg k)$  span
- QED

## Theorem 2

Given a  $\Delta$ -degree graph  $G = (V, E, \rho)$  for some priority function  $\rho$ , let  $G_\rho$  be the priority dag induced on  $G$  by  $\rho$ , and let  $L$  be the depth of  $G_\rho$ . Then  $JP(G)$  runs in  $\Theta(V + E)$  work and  $O(L \lg \Delta + \lg V)$  span

## Lemma 3

The number of length- $k$  simple paths in any  $\Delta$ -degree graph  $G = (V, E)$  is at most  $|V| \cdot \min\{\Delta^{k-1}, (2|E|/(k-1))^{k-1}\}$ .

Lemma 4

$$g(\alpha, \beta) = e^2 \frac{\ln \alpha}{\ln \beta} \ln \left( e \frac{\beta \ln \alpha}{\alpha \ln \beta} \right),$$

Define the function  $g(\alpha, \beta)$  for  $\alpha, \beta > 1$ .

Then for all  $\beta \geq e^2$ ,  $\alpha \geq 2$ , and  $\beta \geq \alpha$ , we have  $g(\alpha, \beta) \geq 1$ .

## Theorem 5

Let  $G = (V, E)$  be a  $\Delta$ -degree graph, let  $n = |V|$  and  $m = |E|$ , and let  $G_\rho$  be a priority dag induced on  $G$  by a random priority function  $\rho \in \mathbb{R}$ . For any constant  $\varepsilon > 0$  and sufficiently large  $n$ , with probability at most  $n^{-\varepsilon}$ , there exists a directed path of length  $e^2 \cdot \min\{\Delta, \sqrt{m}\} + (1 + \varepsilon) \min\{e^2 \ln \Delta \ln n / \ln \ln n, \ln n\}$  in  $G_\rho$ .

# Corollary 6

COROLLARY 6. Given a graph  $G = (V, E, \rho)$ , where  $\rho \in \mathbf{R}$  is a random priority function, the expected depth of the priority dag  $G_\rho$  is  $O(\min\{\sqrt{E}, \Delta + \lg \Delta \lg V / \lg \lg V\})$ , and thus JP-R colors all vertices of  $G$  with  $O(\lg V + \lg \Delta \cdot \min\{\sqrt{E}, \Delta + \lg \Delta \lg V / \lg \lg V\})$  expected span.

# Theorem 8

**THEOREM 8.** *There exists a class of graphs such that for any  $G = (V, E, \rho)$  in the class and for any priority function  $\rho \in \text{SL}$ , JP-SL incurs  $\Omega(V)$  span and JP-R incurs  $O(\lg V / \lg \lg V)$  span.*

# Theorem 9

**THEOREM 9.** *Let  $G = (V, E)$  be a  $\Delta$ -degree graph, and let  $G_\rho$  be the priority dag induced on  $G$  by a priority function  $\rho \in \text{LLF}$ . The expected length of the longest directed path in  $G_\rho$  is  $O(\min\{\Delta, \sqrt{E}\} + \lg^2 \Delta \lg V / \lg \lg V)$ .*

# Corollary 10

COROLLARY 10. *Given a graph  $G = (V, E, \rho)$  for some  $\rho \in \text{LLF}$ , JP-LLF colors all vertices in  $G$  with expected span  $O(\lg V + \lg \Delta(\min\{\sqrt{E}, \Delta\} + \lg^2 \Delta \lg V / \lg \lg V))$ .  $\square$*

# Corollary 12

**COROLLARY 12.** *Given a graph  $G = (V, E, \rho)$  for some  $\rho \in \text{SLL}$ , JP-SLL colors all vertices in  $G$  with expected span  $O(\lg \Delta \lg V + \lg \Delta (\min\{\sqrt{E}, \Delta\} + \lg^2 \Delta \lg V / \lg \lg V))$ .*

## Definition: Vertex-Coloring

- Assignment of a color to each vertex of an undirected graph  $G = (V, E)$ , such that for every edge  $(u, v)$  in  $E$ ,  $u.\text{color} \neq v.\text{color}$
